

The TAAP SmartRepair software application is a job management system for smart repair vehicle technicians, enabling them to create and complete estimates & invoices on mobile devices.

The application uses databases such as HPI vehicle look-up which finds the vehicle details from the registration number entered. All data is saved and uploaded to a secure web portal where estimates and invoices are stored. Estimates can be converted to invoices when accepted by the client.

Benefits

- ⇒ Speeds up invoice processing
- ⇒ Improves customer service
- ⇒ Increases productivity
- ⇒ Eliminates paper
- ⇒ Improves professionalism

Features

- **Vehicle look-up** - using built-in access to the HPI database, the software provides you with accurate vehicle data (make & model, colour, year etc.).
- **Pre-defined repair types** mean that your data is always consistent, which helps with reporting.
- **Default costs** - repairs have default costs associated to them so you don't need to remember any prices, or refer to paper-based documentation. Costs can be overwritten as required.
- **Invoicing running totals** ensure that you don't need paper or calculators to assist with total costs or VAT as they are all calculated for you, no matter how many repairs you make to the same vehicle.
- **Postcode look-up** ensures that customer addresses are verified against a live postcode database built-in to the application.
- **Reports and PDF files of completed jobs.** Use your secure web portal to search for completed jobs, view the details, and email to a client.
