

This application makes it easy to log all time spent on jobs and projects. Ideal for those working in professional services, on-site (builders, engineers, architects etc.), or anybody who needs to bill or record time.

Log on to a job or project to start the timer, and log off the job to stop the timer. Time is automatically recorded so timesheets are unnecessary. Enter your rate per day/hour (if you know it), and the application will calculate the invoicing amount for billing.

Time can be logged as Work In Progress (WIP) so that it is easy to go back later and record time against the same job. The system will then calculate the total time once the job is complete.

Benefits

No need for timesheets - as all time is saved and can be exported to a .csv file for downloading, there is no need to fill in additional timesheets.

Efficient billing cycle - as there is no need to re-key information, invoices can be created as soon as the time relating to a job is processed.

Improved customer service - if you are billing your time on to a client, they can receive customised invoices using your own template. Invoices can be emailed as soon as the job is finished, and billing is accurate due to the time recorder calculations. Edits/amendments are of course possible.

Features

Accurate electronic time recording - time is recorded per minute so any time spent on a job/project can be billed on to the client.

Transpose timesheet/rate details directly to invoice document - create a customised template by adding your company logo, address, VAT no., company reg. no., etc.

Enter rate per hour/day so the time you have entered can be calculated for invoicing purposes. This can be uploaded into your invoice template and edited where necessary.

Invoicing template/editor - create a template by adding company logo, address, VAT no., company reg. no., etc. Edit any billing details here too, before sending to a client.
