

TAAP Transaction

Data sheet

TAAP Transaction processes real-time card payments on mobile devices. Available as a stand-alone system or seamlessly integrated with TAAP Field Force or TAAP Data Capture for information capture/processing.

Benefits

Secure processing - information sent through the Merchant Services Gateway using the secure sockets layer (256 bit encryption). No card details are stored in any of TAAP's systems.

Efficient client service - transactions are processed in real-time, providing your customers with great service.

Instant transaction closed loop - customers receive an sms receipt within 2 seconds of the transaction authorisation.

User enters details of card, amount, and optional mobile telephone number for sms receipt, then click submit to access the Merchant Services Gateway and wait for authorisation.

The Merchant Services Gateway returns a transaction status (i.e. approved/unapproved). If approved, and a mobile number is entered, the client receives an sms receipt for their transaction.

Features

Simple card payment processing - enter the card details (number, expiry date, security code), amount of transaction, and submit for authorisation.

Any merchant services gateway supported - HSBC and Barclaycard already in use. For other merchant services gateways to be set-up, please contact TAAP for prices.

Transaction logs available to view and download via the web - users can view transaction logs via the web and download details into a .csv file for importing into accounts systems.

Signature capture - signatures can also be captured directly on to the PDA (on devices with a stylus) so that card authorisation be obtained without the need to use Chip & PIN technology.
